INSTANCE TYPES AND PRICING

Which instance, and how do you pay for it?

Pick the family for the workload, not the size

INSTANCE FAMILY	TYPICAL WORKLOADS
General Purpose	business-critical apps, small and midsize databases
Compute Optimized	HPC, batch processing, video encoding
Storage Optimized	NoSQL databases, data warehousing
Accelerated Computing	ML, graphics, game and application streaming
Memory Optimized	high-performance databases, real-time analytics

Match the purchasing option to the workload

short-term, unpredictable, no commitment

On-Demand

pay by the second, nothing up front

steady state, can commit 1 or 3 years

Reserved Instances

up to 72% off On-Demand

interruptible batch, flexible timing

Spot Instances

spare capacity, 2-minute notice

server-bound licenses or compliance rules

Dedicated Hosts

a physical server for your use

consistent spend across compute types

S3 STORAGE CLASSES

How often will this data be read?

The access pattern picks the class

STORAGE CLASS	WHEN IT IS THE RIGHT CHOICE
S3 Standard	frequently accessed data, three or more zones
S3 Standard-IA	infrequent access, higher retrieval price
S3 One Zone-IA	infrequent access, stored in a single zone
S3 Intelligent-Tiering	unknown or changing access patterns

SOURCE [docs.aws.amazon.com · Understanding and managing Amazon S3...](https://docs.aws.amazon.com/AmazonS3/latest/userguide/understanding-AmazonS3.html)

Archive classes trade retrieval time for cost

GLACIER CLASS	WHAT YOU GIVE UP FOR THE PRICE
S3 Glacier Instant Retrieval	nothing on speed, archive data in milliseconds
S3 Glacier Flexible Retrieval	wait minutes to hours to get data back
S3 Glacier Deep Archive	the longest wait, for the lowest cost

Two firewalls, at two different boundaries

NETWORK ACL · guards the whole subnet

stateless -- return traffic needs its own rule, and deny rules are allowed here

SECURITY GROUP · guards a single instance

stateful -- return traffic is automatic, and it takes allow rules only
